

# Know- How!

## In the range of Composting, Digestion (AD) and Biomass

### Composting – Digestion – Biomass

Our services include developing project concepts, through design, into consulting to operating facilities, in the areas of biogas and biomass utilisation, in the food and beverage industries, through to community energy facilities and the agro-industry. In order to meet the high standards demanded by our clients, we have put together a consortium of competent partners that offers not only the practical experience of operating one of the most advanced biomass processing centres in the world, including digestion facilities for MSW and food wastes, composting and the conversion of wood wastes to high value bio-fuels, but which also includes an engineering partner that has had many years experience in the design of high performance process plants.

Partnering the businesses within the Biomass Competence Centre (BKZ), which includes

- ▶ KSK Kompostierungs-Service Käßmeyer GmbH
- ▶ Biomassehof Unterallgäu GmbH
- ▶ BIO-Energie Schwaben GmbH is the company BMK-INNOVAS GmbH of Munich, our Know-how and process design and engineering partner.

**INNOVAS** is an experienced industrial plant and process engineering company. They have many years experience in the fields of biogas technologies, particularly in the food and beverage industries.

The BIO-Energie Consulting and **INNOVAS** agreement has resulted in the formation of **BMK-INNOVAS GmbH**,

a cutting-edge consulting group in which the extensive operational experience of the former over many years is bundled with the comprehensive engineering Know-how of the latter. This close cooperation between the two companies with complementary skills brings to our clients the extremely important advantages of synergy.

Only tried and tested technologies are utilised in the design and implementation of our projects. That is the reason that both the technical and economic feasibility performance parameters promised for the digestion projects that we build can be demonstrated in practice and are sustainable in the long term.
